

CONTOUR PULL SCRAPER WITH STOWABLE FILE

5 ABSTRACT OF DISCLOSURE

10 A contour scraper has an elongated handle having an upper curved
convex surface and two arcuate elongated concave lower surfaces and
outwardly proximately flared sides to provide a grip construction, and a
transversely distally disposed blade receiving surface. A two-edged blade is
readily reversibly detachably attached to the handle without the need for
removing a locking screw. The handle grip has an over molded soft
elastomeric cover. The handle is formed with a distal end slotted recess to
slidably receive a file. A rare earth magnet of high magnetic strength
magnetically holds and stows the file in the handle. The handle is formed
15 with a through hole to access the magnetically stowed file for removal
through the end slot.
